Custom TaskOps

Automated validation. Consistent iteration.
A workflow you can customize.

Hugo Ng

Meta

Why I built Custom TaskOps

Repeated prompts, reruns, and tracking each agent's state
leave less attention for difficult issues.

Entry points

Create a task

Harden it

Extend context

Resolve review findings

Common checks & rules

Oracle / setup correctness

Spec clarity / test alignment

Suitable difficulty

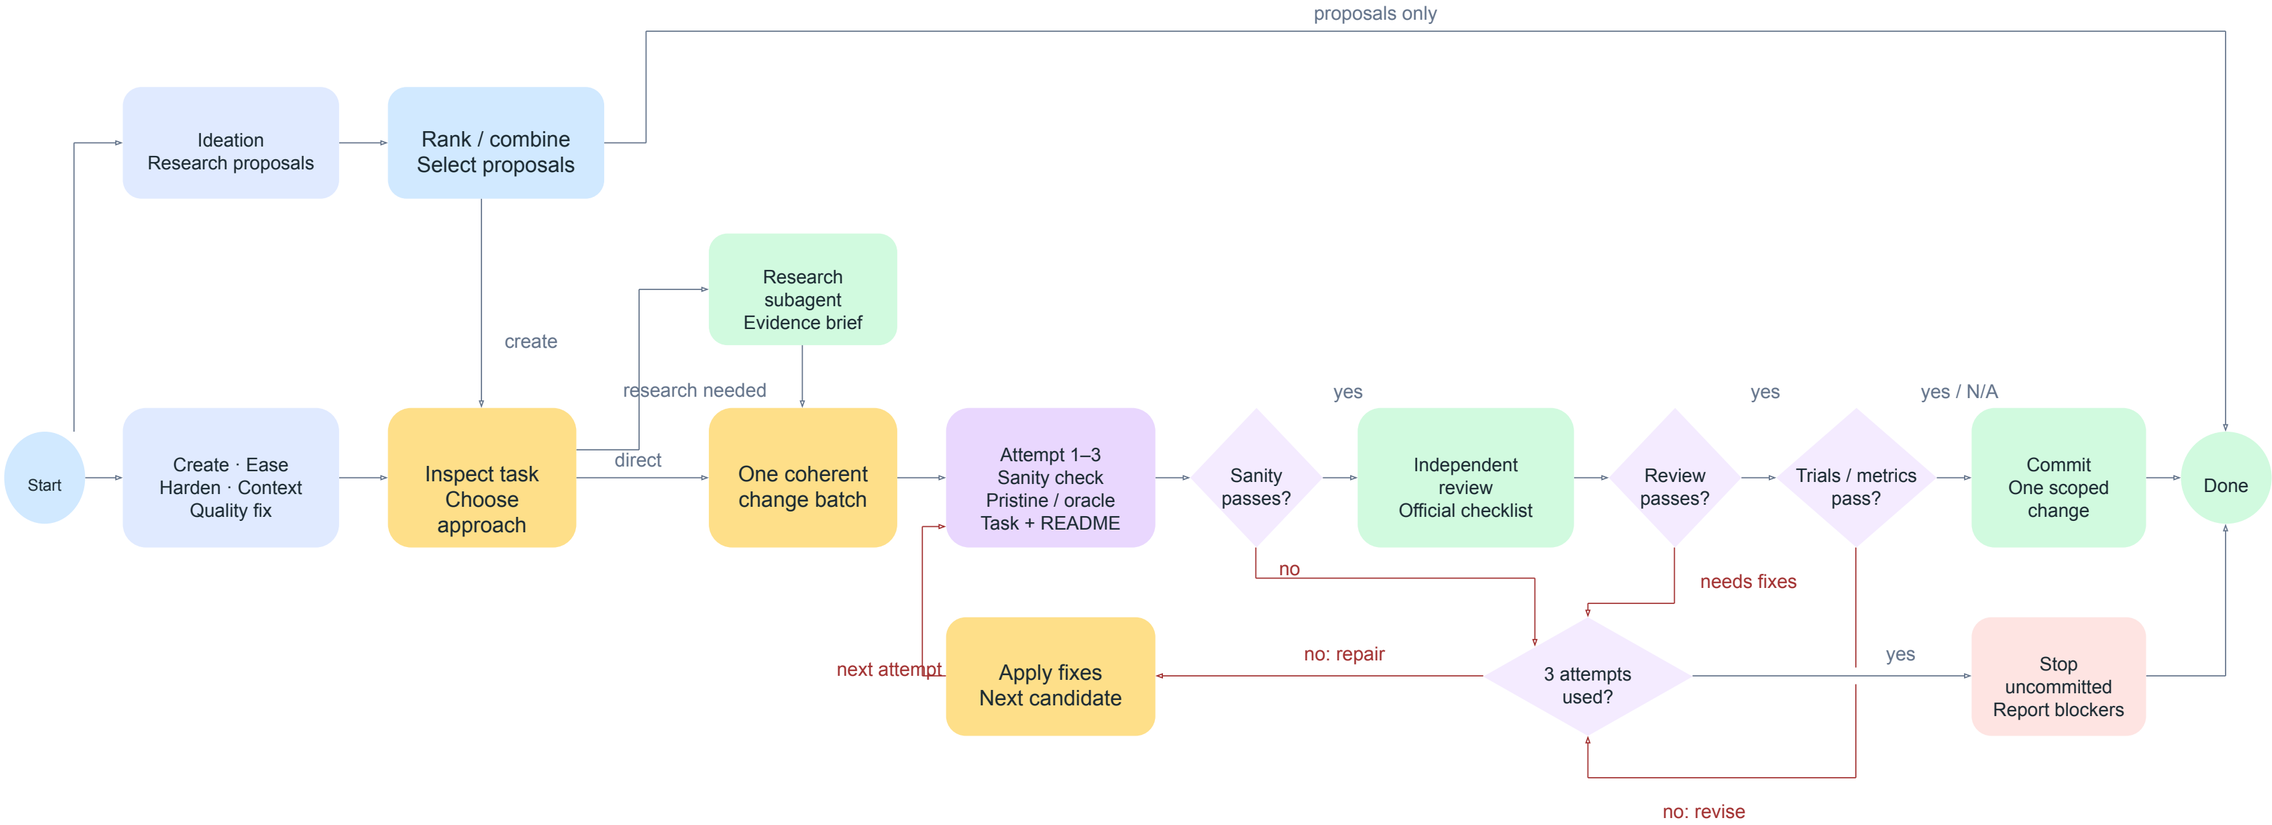

Prevent reward hacking

README: official update-readme, no changelogs

A shared workflow runs checks, fixes, and revalidation without repeated prompts.
Less supervision per task leaves more attention for hard issues and parallel work.

One workflow, from request to validated commit

Quality review checks the task; model trials measure difficulty before commit.

Every substantive edit → fresh sanity → official review → required measurement → scoped commit.

Example operations and validation loop

Different inputs and edits. The same validation and commit rules.

ENTRY SKILL	STARTING POINT	OPERATION-SPECIFIC WORK	ADDITIONAL VALIDATION
`/create-task`	Idea, or automatic ideation	Scaffold spec, tests, environment, and oracle; invoke official README skill.	Measurements required by task/track policy.
`/harden-task`	Existing valid task	Research failure trajectories; collect baseline trials; edit difficulty.	Five comparable candidate trials; meet configured target.
`/quality-fix`	Staged task and review findings	Fetch current-commit findings; repair spec/test alignment, oracle, or verifier.	Difficulty calibration if repairs include tuning.

All three: sanity → official track review → required measurements → scoped commit.

Inside the plugin: customize the workflow

Shared rules travel with you. Profiles adapt the workflow to each track.

A small, editable plugin

```
custom-taskops/
├─ .muse-plugin/plugin.json
├─ skills/<name>/SKILL.md
├─ references/*.md
├─ profiles/*.md
├─ agents/*.md
└─ hooks/task-gate.{sh,py}
```

Copy / fork → register → validate → install

Skills: define the workflow

Write steps and skill handoffs in SKILL.md.
create-task: research → scaffold → validate → commit.

References: share the rules

Reuse sanity, review, retry, and commit policies.
Change a shared preference once for every operation.

Profiles: adapt each track

Set verifier commands and official review routing per track.
Override difficulty / context targets where needed.

agents/: compact research briefs · Task repo AGENTS.md: local commands

hooks/: event scripts; the Stop hook provides quick advisory checks

Ask AI to edit a skill, shared rule, or track profile to match how you work.

From your workflow to your own plugin

github.com/hrnmeta/custom-taskops

1	**Repeated work**	Which steps or repairs keep needing another prompt? Where do existing skills leave manual follow-up?
2	**Your mental model**	Custom steps, reused skills (official review, difficulty tuning), or both? Plan user input, handoffs, required checks, and failure handling. If tuning finishes but validation fails, what happens next?
3	**Adapt, build, iterate**	Adapt Custom TaskOps or build your own plugin; tailor it to how you work. When behavior misses your intent, ask AI to revise the steps or policies. Validate and reinstall; keep refining your defaults and track overrides.

Install / update

```
muse plugins install /path/to/custom-taskops --scope user
muse plugins approve custom-taskops
```
